

The fruit of Summerqueen is round and has more and darker red skin color than Sunhigh, but is not dull.

Summerqueen makes a vigorous, medium-sized tree. The dormant buds are as hardy or somewhat hardier than those of Elberta. The trees of Summerqueen set more flower buds than those of Elberta and Sunhigh. The pollen is abortive but the flowers are

large and showy and attract pollinating insects. Since Summerqueen produces many, showy flowers, it has produced good crops of fruit whenever conditions have been favorable for cross-pollination.

Trees of Goldgem and Summerqueen are available through the New Jersey Peach Council, Inc., R.F.D. #3, Princeton, New Jersey.

Sources of Propagating Wood for Peach and Nectarine Varieties in the United States and Canada

K. W. HANSON¹, L. WHITTON², H. W. FOGLE³, R. M. PETERSON⁴, and H. W. YOUNG⁵

This is the third in a series of lists of sources of propagating wood for fruit varieties. Two previous lists for apple and pear varieties were well received. This response has prompted the new Fruit Gardens Committee of the American Pomological Society to extend this work.

The following is a list of peach and nectarine varieties, and the agricultural colleges and experiment stations in the United States and Canada from which propagating wood can be obtained. The distribution of the propagating wood of a particular variety may be restricted because that variety may be patented or is being grown

under a special agreement with the originator. Special restrictions also are placed on the distribution of scion wood in the West Coast states.

Names of varieties are substantially as submitted by each Station. The Fruit Gardens Committee has attempted to cross-index synonyms in some instances. Some varietal names may not be in full accord with the code of nomenclature.

The purpose of this list is to provide persons who are concerned with the breeding and testing of peach and nectarine varieties, professional and amateur alike, with an available source of propagating wood.

Mutsu Apple

The Mutsu apple is a Golden Delicious cross developed in Japan. Fruit closely resembles Golden Delicious, has a beautiful finish and has shown no russetting in the two years it has fruited at Storrs, Connecticut. It is excellent for processing.

Sonjana, a New Strawberry

Sonjana is the name of a new strawberry variety released in Germany, but for which a United States plant patent, number 1,691, was granted on March 18, 1958. It is the result of crossing Holstein and Sonja Horstmann. Reinhold Hummel of Stuttgart is the originator. It is everbearing, maturing between May 25 and October 15 at its place of origin, but is in its prime condition at the end of May. Since Sonjana produces vigorous runners which may be espaliered or trained on a support, it is termed a "climber".
R. M. Brooks, Davis, California.

Tejon has just been commercially introduced by the California Citrus Experiment Station. It is a yellow-fleshed, semi-clingstone peach which matures quite early in southern California. Dr. J. W. Lesley developed it from six crosses and one selfing involving a Peento hybrid, Columbiana, Strawberry, Rochester, and Early Imperial. It has a short winter-chilling requirement and therefore is suitable for warm-winter climates. It most nearly resembles Maygold.—*R. M. Brooks, Davis, Cal.*
