

APPLES FOR KENTUCKY

Dear Mr. Bregger:

In our apple areas that are suitable for early apple production, I feel sure that I would not plant any of the later varieties, as there seems to be just as much opportunity for profit in the early ones as in any of the late ones, and the codling moth problem would also be greatly reduced.

We are testing quite a large number of apples of the Transparent season, and though I might change my mind in another year or two, at present I would be strongly inclined to plant rather heavily of Lodi. In other areas of Kentucky I think my vote would go to Wealthy as the leading commercial variety, and I do not think I would plant any of the winter varieties, because of our third brood carrying over of codling moth.

**BRISTOL AND MORRISON
BLACK RASPBERRIES**

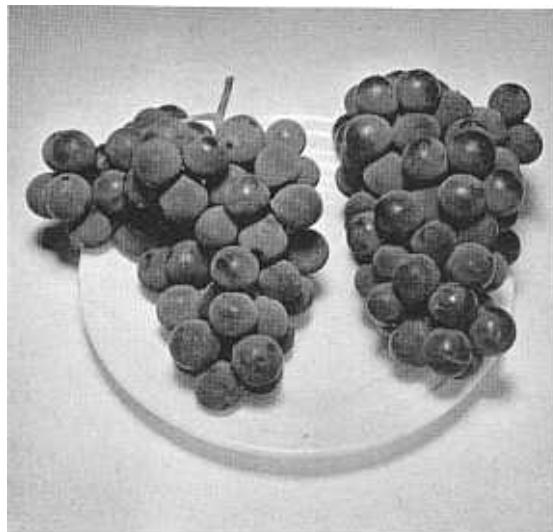

Dear Sir:

We have found that the Morrison black raspberry continues to prove its worth in the north central states but is developing considerable anthracnose farther south.

Bristol has proven to be about the most widely adapted of all the black caps, being grown satisfactorily as far south as Oklahoma.

Van Buren, best of the new early blue grapes in New York.

A FAVORITE EATING GRAPE

Dear Sir:

The Krause is my favorite eating grape. The vine is a stronger grower and has withstood the winters here during the past twenty-five years. It is very productive, fruiting a large bunch of large berries. It cannot be classified as a sweet grape. The flavor is rich and because there is some tartness it is more highly flavored than sweet grapes.

At one time I liked sweet grapes best but my taste has changed to the more high flavored grapes. The comparison is just the same as liking a mildly tart apple better than a sweet apple.
